Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS

1. (Original) A storage disk, comprising:

a plurality of sectors positioned on a surface of the storage disk so as to be read by a storage device, each sector having a header section and a data section;

wherein the header section comprises a plurality of address blocks, each address block containing an address mark followed by an address field, each address field within a sector having the same address data coded in a biphase format for identifying sector address, each address mark being distinguishable from the biphase coded address data.

- 2. (Original) The storage disk of claim 1 wherein the plurality of sectors are positioned on adjacent land and groove tracks and the respective address sections are repeated alternately on the land track and groove tracks in a checkerboard format.
- 3. (Original) The storage disk of claim 1 wherein the address data is sampled with an asynchronous clock.
- 4. (Original) The storage disk of claim 3 wherein the address data includes a predetermined number of data bits with each data bit being a predetermined number of channel bits long, wherein each data bit includes a mark-space or space-mark transition at a predetermined location.
- 5. (Original) The storage disk of claim 4 wherein the address data is six channel bits long and includes a 3T mark and a 3T space.
 - 6. (Original) The storage disk of claim 1 wherein the address data is embossed.
- 7. (Original) The storage disk of claim 1 wherein the address section further includes an error detection field.

- 8. (Original) The storage disk of claim 5 wherein the address mark is made up of marks and spaces four channel bits long.
- 9. (Original) The storage disk of claim 4 wherein the address mark is made up of marks and spaces each having a length not equal to one-half the predetermined number of channel bits making up the data bits.
- 10. (Original) A storage media for use in a data storage system, comprising: a storage substrate having a storage surface with a plurality of groove tracks and land tracks, the storage surface having a plurality of storage sectors for storing data with each storage sector comprising a header and a data storage field;

wherein the header is configured to have a plurality of repeated address blocks; and wherein each of the plurality of address blocks comprise an address mark, an address field, and a error check field, the address field made up of a plurality of biphase cells to store a sector address in a biphase data format and the address mark made up of a distinct signal not found in the address field.

- 11. (Original) The storage media of claim 10 wherein the address blocks of adjacent tracks are written to both the land and groove tracks and are configured in a checkerboard format.
- 12. (Original) The storage media of claim 10 wherein only the land tracks are utilized and the address blocks of adjacent land tracks are written in a checkerboard format.
- 13. (Original) The storage media of claim 10 wherein only the groove tracks are utilized and the address blocks of adjacent groove tracks are written in a checkerboard format.
- 14. (Original) The storage media of claim 10 wherein each biphase cell is configured to have a mark-space or space-mark transition at a point in substantially the center of thereof.
- 15. (Original) The storage media of claim 14 wherein each biphase cell has a predetermine size comprising a predetermined number of channel bits.

In reply to Office Action mailed March 15, 2007

Page 4 of 6

- 16. (Original) The storage media of claim 15 wherein the predefined number of channel bits is six in length and the biphase cell includes a mark and a space, each being three channel bits in length.
- 17. (Original) The storage media of claim 15 wherein the predetermined number of channel bits is eight in length and the biphase call includes a mark and a space, each being four channel bits in length.
- 18. (Original) The storage media of claim 16 wherein the address bit comprises marks and spaces four channel bits in length.
- 19. (Original) The storage media of claim 14 wherein the address marks are made up of marks and spaces of a size not occurring in the biphase cell.
- (Original) A method of configuring a storage media for robust addressing, comprising

defining a plurality of storage sectors on the storage media;

defining a header field with each storage sector; and

embossing a plurality of address blocks within the defined header field, each address block beginning with at least one address mark having a predetermined configuration, followed by an address field made up of a plurality of biphase cells, each biphase cell having a mark and a space with a transition in substantially the center thereof, the address block ending with an error detection code.

- 21. (Original) The method of claim 20 wherein each biphase cell is a predetermined number of channel bits long and the marks and space within each biphase cell each fill substantially one half of the biphase cell.
- 22. (Original) The method of claim 21 wherein the address marks are made up of marks and spaces having a dimension unequal to the marks and spaces within the biphase cells.
